

# Solar Test Field Maintenance

## Introduction

Maintenance in the Solar Test Field means keeping the systems and surroundings in good order, and also solving the little issues that become visible when systems or modules are in daily use.

Maintenance in this sense is also a continual upgrade process, including user feedback in order to make, for example, our solar kitchen a more attractive place for living, working and welcoming visitors.

This is a vital part of regenerative energy projects, particularly in an experimental/development context such as the Solar Test Field.

## What We Plan

This budget covers material costs for replacing worn and damaged items, and gives us the possibility of supporting some of the living costs of people who do the work.

## **Wished-For Annual Maintenance Budget: 10,000 euros**

Smaller amounts are also very helpful and welcome!
